

Field Data Acquisition Unit (FieldAQ)

WaterFurnace requires a field data acquisition unit that collects temperature and pressure data, and then transfers the data using a modem to a personal computer. The device must have a user friendly software interface. The device will be used to monitor units in the field all over the country, and possibly the world. The data will then be sent to WaterFurnace engineers for analysis.

This page will be updated in the future as more details about the project are finalized.
